Amazon One-Click Patent

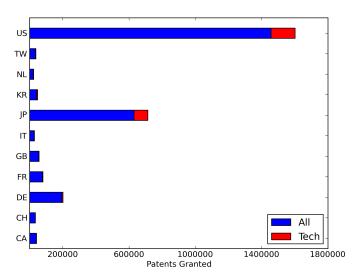

A method and system for placing an order to purchase an item via the Internet. The order is placed by a purchaser at a client system and received by a server system. The server system receives purchaser information including identification of the purchaser, payment information, and shipment information from the client system. The server system then assigns a client identifier to the client system and associates the assigned client identifier with the received purchaser information. The server system sends to the client system the assigned client identifier and an HTML document identifying the item and including an order button. The client system receives and stores the assigned client identifier and receives and displays the HTML document. In response to the selection of the order button, the client system sends to the server system a request to purchase the identified item. The server system receives the request and combines the purchaser information associated with the client identifier of the client system to generate an order to purchase the item in accordance with the billing and shipment information whereby the purchaser effects the ordering of the product by selection of the order button.

- ▶ Bubble jet recording method and apparatus in which a heating element generates bubbles in a liquid flow path to project droplets.
- ► Canon Ink Jet printers.

The evidence (and the common sense of anyone involved with OS software) shows that the source of competitive rents is the complementary sale of expertise.

...only small rents can be obtained through the sale of copies. [Purchasers] also have a demand for services, ranging from support and consulting to customization. They naturally prefer to hire the creators of the programs who in the process of writing the software have developed specialized expertise that is not easily matched by imitators.

- Boldrin & Levine (2009)

- ► Control over product performance.
- ▶ Hobbyists and enthusiasts.
- ▶ Display of skill or resume padding.
 - ▶ Hall et. al
- ► Competitive rents (Boldrin & Levine).
 - ▶ Which model version fits?
 - ▶ What can we say about the implications?

- ► Control over product performance.
- ► Hobbyists and enthusiasts.
- ▶ Display of skill or resume padding.
 - ▶ Hall et. al
- ► Competitive rents (Boldrin & Levine).
 - ▶ Which model version fits?

s.t.
$$\lambda k_t + \overline{x}(k_t) \ge k_{t+1} \ge \lambda k_t$$

▶ As before, $q_0 = \nu'(k_0) > 0$ yields positive competitive rents

Caleb Floyd and Tom Augspurger Patents and Innovation in Software

- ► Given $\{k_t, x_t, L_t\}$, the solution $c_t = T(k_t, x_t, L_t)$ traces a production possibility frontier graph here
- $ightharpoonup L_t$ solves $\max_{L_t} u[T(k_t, x_t, L_t)] wL_t$
- ► The problem restated:

$$\nu(k_0) = \max_{\{k_t\}_{t=1}^{\infty}} \sum_{t=0}^{\infty} \beta^t V(k_t, k_{t+1} - \lambda k_t)$$
s.t.
$$\lambda k_t + \overline{x}(k_t) \ge k_{t+1} \ge \lambda k_t$$

▶ As before, $q_0 = \nu'(k_0) > 0$ yields positive competitive rents

Open source innovation and selling expertise

- ▶ Additional productive capacity only requires labor to be produced: $x_t = G(L_t)$ (labor is chosen according to $L_t = g(x_t)$)
- ► Consumption (services) is produced from productive capacity $c_t = f(h_t)$
- ▶ The innovator comes into the market with productive capacity of h_0
 - ► As soon as this occurs, others can begin accumulating productive capacity (expertise in the software)
 - $h_{t+1} = x_t + (1 \delta) * h_t$

- ► Consumer utility same as the general case
- ► Planners Problem:

$$\nu(h_t) = \max_{x_t > 0} \{ u(c_t) - wg(x_t) + \beta \nu(h_{t+1}) \}$$

► First order condition:

$$wg'(x_t) = \beta \nu'(h_{t+1})$$

- lacktriangledown This can be decentralized with prices p_t,q_t for services and capital
 - $ightharpoonup p_t = u'(c_t)$
 - $q_t = \nu'(h_t) = u'(c_t)f'(h_t) + \beta(1-\delta)\nu'(h_{t+1})$

► Rearranging we get:

$$q_0 = sum_{t=0}^{\infty} (\beta(1-\delta))^t u'(c_t) f'(c_t)$$

- ▶ The open source innovation is viable as long as $q_0k_0 > C$
- ▶ Perhaps more elucidating:

$$q_0 = \underbrace{u'(c_0)f'(h_0)}_{\text{first mover advantage}} + \underbrace{(1-\delta)wg'(x_0)}_{\text{cost of imitation}}$$

Technology-Final Good

- ▶ Output of final good: Y(t) = C(t).
- ▶ Production of Y(t):

$$\ln Y(t) = \int_0^1 \ln y(j, t) dy$$

where y(j,t) is the quantity of intermediate good j used.

▶ Perfect substitutes between intermediate varieties.

Technology-Final Good

- ▶ Output of final good: Y(t) = C(t).
- ightharpoonup Production of Y(t):

$$\ln Y(t) = \int_0^1 \ln y(j, t) dj$$

where y(j,t) is the quantity of intermediate good j used.

Perfect substitutes between intermediate varieties.

Technology-Final Good

- ▶ Output of final good: Y(t) = C(t).
- ightharpoonup Production of Y(t):

$$\ln Y(t) = \int_0^1 \ln y(j, t) dj$$

where y(j,t) is the quantity of intermediate good j used.

▶ Perfect substitutes between intermediate varieties.

- ▶ Each industry $j \in [0, 1]$ has two firms competing. Firms denoted by i (leader) and -i (follower).
- ▶ Intermediate goods produced according to:

$$y(j,t) = q_i(j,t)l_i(j,t)$$

where q_i is a technology level and l_i is labor used.

► Yields marginal cost:

$$MC_i(j,t) = \frac{w(t)}{q_i(j,t)}$$

► Limit pricing:

$$p(j,t) = \frac{w(t)}{q_{-i}(j,t)}$$

where -i denotes the follower (less advanced technology).

▶ Cobb-Douglas production of final good implies:

$$y(j,t) = \frac{q_{-i}(j,t)}{w(t)}Y(t)$$

- ▶ Each industry $j \in [0,1]$ has two firms competing. Firms denoted by i (leader) and -i (follower).
- ▶ Intermediate goods produced according to:

$$y(j,t) = q_i(j,t)l_i(j,t)$$

where q_i is a technology level and l_i is labor used.

- ▶ Preserves stationarity of the value functions.
- Law of motion for technology gap in industry j:

$$\eta_{j}(t + \Delta t) = \begin{cases} \eta_{j}(t) + 1 & \text{prob } x_{i}(j, t) \Delta t + o(\Delta t) \\ 0 & \text{prob } x_{-i}(j, t) \Delta t + \eta_{n_{j(t)}} \Delta t + o(\Delta t) \\ \eta_{j}(t) & \text{with the remainder} \end{cases}$$

 \blacktriangleright Write the patent policy as $\eta: \mathbb{N} \to \mathbb{R}$.

- ▶ Patents expire at Poisson rate: $\eta_{n_i}(t)$
- ▶ Preserves stationarity of the value functions.
- Law of motion for technology gap in industry j:

$$\eta_{j}(t + \Delta t) = \begin{cases} \eta_{j}(t) + 1 & \text{prob } x_{i}(j, t) \Delta t + o(\Delta t) \\ 0 & \text{prob } x_{-i}(j, t) \Delta t + \eta_{n_{j(t)}} \Delta t + o(\Delta t) \\ \eta_{j}(t) & \text{with the remainder} \end{cases}$$

• Write the patent policy as $\eta: \mathbb{N} \to \mathbb{R}$.

Equilibrium

- ▶ $\mu(t) \equiv \mu_n(t)_{n=0}^{\infty}$ is a distribution of *industries* over *technology gaps*.
- ▶ Define an Allocation as a sequence of decisions for leaders and followers, sequence of wage rates, and a sequence of distributions over gaps.
- ▶ Define an Equilibrium as a sequence of decisions, wages, and output such that markets clear, firms' expected profits are maximized, and R&D policies are best responses.

Equilibrium

- ▶ $\mu(t) \equiv \mu_n(t)_{n=0}^{\infty}$ is a distribution of *industries* over *technology gaps*.
- ▶ Define an Allocation as a sequence of decisions for leaders and followers, sequence of wage rates, and a sequence of distributions over gaps.
- ▶ Define an Equilibrium as a sequence of decisions, wages, and output such that markets clear, firms' expected profits are maximized, and R&D policies are best responses.

Equilibrium

- ▶ $\mu(t) \equiv \mu_n(t)_{n=0}^{\infty}$ is a distribution of *industries* over *technology gaps*.
- ▶ Define an Allocation as a sequence of decisions for leaders and followers, sequence of wage rates, and a sequence of distributions over gaps.
- ▶ Define an Equilibrium as a sequence of decisions, wages, and output such that markets clear, firms' expected profits are maximized, and R&D policies are best responses.

Labor Market

- ► Three sources of demand: Production of intermediaries, and R&D by each firm.
- ▶ Combine demand for intermediates: $y(j,t) = q_i(j,t)l_i(j,t)$, and

$$l_n(t) = \frac{\lambda^{-n}Y(t)}{w(t)}$$

$$1 \ge \sum_{n=0}^{\infty} \mu_n(t) \left[\frac{1}{\omega(t)\lambda^n} + G(x_n(t)) + G(x_{-n}(t)) \right]$$

Labor Market

- ▶ Three sources of demand: Production of intermediaries, and R&D by each firm.
- ► Combine demand for intermediates: $y(j,t) = q_i(j,t)l_i(j,t)$, and $y(j,t) = \frac{q_{-i}(j,t)}{w(t)}Y(t)$ to get

$$l_n(t) = \frac{\lambda^{-n}Y(t)}{w(t)}$$

and so

$$1 \ge \sum_{n=0}^{\infty} \mu_n(t) \left[\frac{1}{\omega(t)\lambda^n} + G(x_n(t)) + G(x_{-n}(t)) \right]$$

where $\omega(t)$ is labor's share of income.

▶ Net present value when leading by n:

$$V_n(t) = \mathbb{E}_t \int_t^\infty exp(-r(s-t))[\Pi(s) - w(s)G(\hat{x}(s))] ds$$

▶ As a "normalized" value function $(v_n(t) = V_n(t)/Y(t))$:

$$pv_n = \max_{x_n \ge 0} (1 - \lambda^{-n}) - \omega^* G(x_n) + x_n [v_{n+1} - v_n] + [x_{-n}^* + \eta_n] [v_0 - v_n]$$

- ▶ Instantaneous operating profits: $(1 \lambda^{-n})$.
- ▶ R&D costs: $\omega^*(t)G(x_n(t))$.
- ▶ With probability $x_n(t)$ you innovate.
- ▶ With probability $x_{-n}^*(t) + \eta_n$ he innovates or your patent expires.

▶ Net present value when leading by n:

$$V_n(t) = \mathbb{E}_t \int_t^\infty exp(-r(s-t))[\Pi(s) - w(s)G(\hat{x}(s))] ds$$

► As a "normalized" value function $(v_n(t) = V_n(t)/Y(t))$:

$$pv_n = \max_{x_n \ge 0} (1 - \lambda^{-n}) - \omega^* G(x_n) + x_n [v_{n+1} - v_n] + [x_{-n}^* + \eta_n] [v_0 - v_n]$$

- ▶ Instantaneous operating profits: $(1 \lambda^{-n})$.
- ▶ R&D costs: $\omega^*(t)G(x_n(t))$.
- ▶ With probability $x_n(t)$ you innovate.
- ▶ With probability $x_{-n}^*(t) + \eta_n$ he innovates or your patent expires.

 \blacktriangleright Net present value when leading by n:

Uniform Policy

Problem is identical for all followers.

Given some assumptions (positive R&D, non-zero profits) . . .

- ▶ $v_{-1} \le v_0$; $\{v_n\}_{n=0}^{\infty}$ is bounded and strictly increasing.
- $\quad \ \ \, x_0^*>x_1^*,x_0^*\geq x_{-1}^*, \, \text{and} \, \, x_{n+1}^*\leq x_n^* \, \, \forall n\in \mathbb{N}.$
- ▶ Tied firms innovate the most.
- ▶ Past that innovation is decreasing in the gap.

Uniform Policy

Problem is identical for all followers.

Given some assumptions (positive R&D, non-zero profits) . . .

- ▶ $v_{-1} \le v_0$; $\{v_n\}_{n=0}^{\infty}$ is bounded and strictly increasing.
- $\quad \bullet \ \, x_0^* > x_1^*, x_0^* \geq x_{-1}^*, \text{ and } x_{n+1}^* \leq x_n^* \,\, \forall n \in \mathbb{N}.$
- ► Tied firms innovate the most.
- ▶ Past that innovation is decreasing in the gap.

Optimal Uniform IPR

- ▶ Turns out that if $\eta_n = \eta \ \forall n, \ \eta^* = 0$ (Patents never expire).
- ▶ Positive composition effect (more firms in close competition) overwhelmed by negative disincentive effect.

Optimal Uniform IPR

- ▶ Turns out that if $\eta_n = \eta \ \forall n, \ \eta^* = 0$ (Patents never expire).
- ▶ Positive composition effect (more firms in close competition) overwhelmed by negative disincentive effect.

Optimal State-Dependent IPR

- ▶ Growth rate increases from 1.86% to 2.04%.
- ▶ Optimal patent length is increasing in technology gap.

Optimal State-Dependent IPR

- ► Growth rate increases from 1.86% to 2.04%.
